

Qenrec

Company, Product & Brand Bible

Version 1.1 | 12 August 2026

Strategic master document and authorship/IP record for the selected project identity “Qenrec.” Formal trademark, company-name, domain, and registration clearance remain separate legal actions.

Purpose of this Bible: to preserve the strategic definition, product architecture, brand direction, design principles, technical intent, and ownership record of the project in one controlled reference document. It is written so that a founder, designer, developer, adviser, investor, or lawyer can understand what is being built, why it exists, and which decisions are intended to govern its future development.

Ownership note: this document can serve as contemporaneous evidence of the project’s documented expression, authorship, chronology, and intended ownership structure. It does not by itself confer exclusive rights over a business idea, company name, or operating concept. Specific rights should be secured through the appropriate corporate, trademark, copyright, contractual, and—where applicable—patent or design processes.

Document Control. Record of authorship, status and controlled use

Document	Qenrec - Company, Product & Brand Bible
Version	1.0
Date	12 August 2026
Project identity	Qenrec (selected brand name)
Founder / rights holder	[Insert legal name]
Jurisdiction for initial legal actions	Nigeria
Classification	Confidential - Founder / Authoritative Working Copy

Document purpose

The purpose of this document is to consolidate the project's company foundation, product definition, brand strategy, visual identity direction, user experience philosophy, technology direction, business model, and legal/IP action plan. It is intended to reduce ambiguity as the project moves from concept to prototype, software build, market validation, incorporation, and commercial operation.

Authority of this document

Where later product, design, or engineering decisions conflict with this Bible, the latest approved version controls. Changes should be versioned, dated, and recorded. Major changes to the product thesis, brand identity, or ownership structure should be accompanied by a written rationale so the project retains a clear development history.

1. Executive Definition

What Qenrec is and what it is becoming

Qenrec is a proposed software-as-a-service platform for creative and digital agencies that improves the transition between winning a project and being genuinely ready to execute it. The working product begins with a simple problem: agencies need accurate information, assets, decisions, requirements, goals, budgets, timelines, and approvals from clients before meaningful work can begin, yet those inputs often arrive across unrelated channels and in inconsistent formats.

The product responds by giving an agency one professional, branded client experience through which the client can provide the information and files required for a project. Qenrec then turns those inputs into a structured project record that the agency can review, clarify, approve, and ultimately use as a foundation for project execution.

The strategic ambition is larger than online forms. The long-term direction is to own the handoff between client conversation and project execution: collecting the information, organizing it, understanding it, identifying gaps and risks, translating it into requirements, and eventually activating it into project plans and execution systems.

CORE IDEA

Qenrec exists to make the beginning of client work dependable. Great execution starts with understanding. The product is designed to turn fragmented client input into a clear, usable, execution-ready project record.

Working product category

Client onboarding, project discovery, project-readiness, and execution-handoff SaaS for service businesses.

Initial beachhead

Web design and development agencies. The broader market may include branding agencies, marketing agencies, SEO agencies, software studios, UI/UX teams, consultants, creative studios, photographers, architects, and other service providers that repeatedly gather structured information from clients before work starts.

2. The Problem and Opportunity

Why the workflow deserves a product

The current project-starting process in many service businesses is fragmented. A client may send a logo through a messaging app, describe the business in a document, provide requirements in an email, share competitors through links, upload assets to cloud storage, and remember additional requirements only after the project has already begun. The result is not merely inconvenience: fragmented inputs can create uncertainty about scope, missing assets, contradictory decisions, repeated follow-up, avoidable delays, and rework.

The opportunity is therefore not to invent a new questionnaire. The opportunity is to create a reliable operational boundary between the client and the service provider. That boundary should make it clear what the project is, what is known, what is missing, what has been decided, what remains uncertain, and what is safe to begin.

Underlying business pain

The deeper business problem is premature execution. Teams begin work without a sufficiently clear understanding of the problem, scope, constraints, assets, or success criteria. The resulting cost appears later as project delay, scope conflict, repeated communication, unplanned effort, and reduced margin.

Opportunity thesis

If Qenrec can become the place where a service business establishes a reliable project baseline before execution, the product can create value beyond intake. That baseline can later support project scope, proposal generation, risk detection, requirements extraction, planning, client clarification, and integrations with execution systems.

What Qenrec must not become

The product should not become a generic form builder, CRM clone, accounting product, or broad project-management suite merely because those markets exist. The distinctive territory is the project handoff: client information in, project readiness and structured project understanding out.

3. Product Definition

The first product and its internal logic

At its simplest, the agency creates a project, selects or builds a briefing template, and generates a secure client experience. The client completes a guided journey covering the business, brand, audience, project goals, requirements, competitors, content, budget, timeline, and files. The agency receives the submission in a structured workspace and can request clarification before considering the project ready.

Core agency journey

1. Create an agency workspace.
2. Create a project and identify the client.
3. Choose or customize a briefing template.
4. Generate a branded client link.
5. Client completes the guided brief, with autosave and resume support.
6. Client uploads categorized files and submits the brief.
7. Agency reviews the structured record.
8. Agency requests clarification where necessary.
9. Project status moves toward readiness and execution.

Core information model

The conceptual object hierarchy is: User -> Workspace -> Project -> Client -> Brief -> Sections -> Questions -> Answers, with Files and Activity attached to the relevant project. This relational model is intentionally designed to support structured retrieval, reporting, permissions, and future intelligence features.

Dynamic form engine

The technical foundation is a dynamic form engine. Questions should be data-driven rather than hardcoded into individual pages. A question has properties such as type, label, required status, section, position, and optional conditional logic. This enables reusable templates, custom agency workflows, and future expansion without rebuilding the client experience from scratch.

Question types for the first product

- Short text
- Long text
- Email
- URL
- Number
- Single choice
- Multiple choice
- Dropdown

- Date
- File upload
- Color picker
- Rating
- Yes/No

Later form capabilities

Conditional questions, ranking, matrix inputs, image selections, signatures, and richer branching logic can be introduced after the core workflow is proven.

4. Strategic Positioning

The territory Qenrec should own

POSITIONING STATEMENT

For service businesses that repeatedly need accurate information from clients before work begins, Qenrec is a project-intake and readiness platform that turns fragmented client input into an organized, execution-ready project record.

Category framing

Qenrec should be described as a project-intake and readiness platform, not merely a questionnaire product. The language should emphasize the business outcome: clarity before execution.

Primary promise

Know what you are building before you start building it.

Supporting promise

One client experience for the information, assets, decisions, and requirements your team needs to start work with confidence.

Differentiation

The category contains established form, client-portal, and agency-workflow products. Qenrec should therefore avoid competing only on visual polish. Its defensible direction is to connect collection to project understanding: completeness, clarity, missing decisions, risk detection, requirements extraction, and project readiness.

Strategic wedge

The first market is web design and development agencies. This provides a narrow enough workflow to produce a strong template, a specific marketing message, and a clear sales conversation. Broader service categories should be earned through observed demand rather than assumed from day one.

5. Target Market and Customer Profile

Who should pay and why

Ideal customer profile

The initial ideal customer is a small to mid-sized web agency or independent professional who runs repeated client projects and experiences friction around discovery, onboarding, asset collection, requirements clarification, or project kickoff.

Characteristics of a strong customer

- Runs multiple client projects each month.
- Uses a mix of email, messaging, cloud storage, documents, or forms to collect information.
- Experiences repeated follow-up for missing information.
- Has experienced scope confusion or rework caused by unclear client input.
- Already values process and documentation.
- Can understand a monthly software subscription as an operating expense.

Buying trigger

The strongest buying trigger is not that the customer wants a prettier form. It is that client onboarding is slowing project kickoff, creating scope uncertainty, or consuming meaningful staff time.

Customer value

Value should be expressed in saved time, fewer follow-ups, fewer missing assets, fewer avoidable scope surprises, faster kickoff, and a more professional client experience.

Expansion path

Once the web-agency workflow is demonstrably useful, the same underlying system can expand into branding, marketing, software development, SEO, architecture, consulting, and other services where the same collection-to-execution pattern exists.

6. Product Philosophy and Experience

The principles that govern the product

Clarity

Every screen should reduce uncertainty. Labels should be understandable without training.

Calm

The interface should feel controlled and reassuring rather than busy, loud, or overly animated.

Humanity

The client is a person participating in a project, not a record being harvested for a database.

Momentum

Every interaction should help the user make visible progress toward a complete project brief.

Structure without rigidity

The system should impose enough organization to be useful while allowing agencies to adapt the process to their work.

Professionalism

The client should perceive the experience as part of the agency's service quality.

Readiness over completion

A form being 100% complete is not the same as a project being ready. The product should ultimately measure readiness, not merely answer count.

PRIMARY UX TEST

Make clients want to finish the brief. If a complete brief still leaves the agency uncertain about what to build, the product has not achieved its purpose.

7. Brand Strategy

A brand built around clarity and confident execution

Brand status

Qenrec is the selected brand name for the project. It is the identity adopted by the founder for this version of the product and brand system. Formal company-name availability, trademark clearance, domain acquisition, and other registration steps remain separate legal and commercial actions and should be completed before irreversible public commitments.

Brand essence

From fragmented input to confident action.

Brand personality

Clear, calm, professional, intelligent, and human. The identity should signal competence without feeling corporate, and intelligence without leaning on exaggerated AI visual tropes.

Brand promise

Qenrec gives service teams a better beginning: one clear place to understand the client, define the project, and prepare for execution.

Brand voice

Use plain language, confident statements, concise explanations, and useful guidance. Avoid empty startup language, exaggerated claims, artificial urgency, and unnecessary jargon. The brand should sound like an experienced project partner.

Messaging territory

Core messages should revolve around readiness, clarity, structured client input, fewer follow-ups, better project starts, and stronger handoffs. Avoid positioning the product primarily as a form builder or generic AI tool.

8. Visual Identity System

Selected visual direction

Color philosophy

The primary brand direction is Rufous, a reddish-brown / brownish-red color associated with rust and oxidised iron. The selected primary color is Rufous #A81C07. The hue gives Qenrec a grounded, confident, distinctive visual character while avoiding the overused blue/purple SaaS palette. Rufous should function as a controlled brand signal for primary actions, active navigation, progress, focus, key links, and signature identity elements; most of the interface should remain neutral.

	Rufous	#A81C07 - Primary brand signal; primary actions, active states, links, progress, focus, signature identity elements.
	Deep Rufous	#751206 - Deep anchor; headings, strong emphasis, high-contrast brand applications.
	Soft Blush	#FBE6E1 - Soft brand field; selected surfaces, callouts, supportive backgrounds.
	Warm White	#F8FAF8 - Primary canvas; creates a softer, more editorial environment than stark white.
	White	#FFFFFF - Core surface for cards, forms, dialogs, and high-priority content areas.
	Deep Charcoal	#17211D - Primary text and high-contrast content.
	Warm Slate	#6F625E - Muted text, metadata, supporting information.

Semantic colors

Rufous - primary color note

Rufous #A81C07 is the selected primary brand color. Rufous is commonly described as reddish-brown or brownish-red, resembling rust or oxidised iron. The founder-selected color is intended to give Qenrec a grounded, memorable, confident visual signature. The historical color-name note supplied for the brand record states that the first recorded use of “rufous” as a color name in English was in 1782, with an earlier 1527 diagnostic-use record. This historical note is retained as part of the founder’s brand rationale and is not presented as a legal or scientific claim without independent verification.

Success, warning, danger, and informational states should remain distinct from Qenrec Rufous. Semantic colors communicate system meaning rather than brand personality.

Typography

IBM Plex Sans remains the leading candidate because it combines human and engineered qualities and is suitable for dense product interfaces, forms, metrics, and structured information. The working type system is: display/headlines in 600, body in 400, labels and buttons in 500, and metrics in 600. IBM Plex Mono may be reserved for IDs, URLs, project codes, and technical metadata.

Logo philosophy

The future identity should communicate a meaningful transformation: connection between client and agency, movement from noise to signal, or conversion of unstructured information into direction. The mark should have a conceptual story and should not rely on generic circles, initials in containers, network nodes, or arbitrary geometric symbols.

Visual restraint

Gradients should not be a primary branding device. Excessive glassmorphism, floating blobs, oversized shadows, decorative AI imagery, and generic dashboard motifs should be avoided. The interface should derive its character from typography, whitespace, hierarchy, proportion, and precise use of the Rufous accent.

9. Product UX and Information Architecture

The experience that connects the agency and the client

Primary navigation

- Dashboard
- Projects
- Templates
- Clients
- Files
- Settings

Agency experience

The agency experience should make project status, next actions, client readiness, and project completeness easy to understand. A project card should communicate the project identity, client, status, progress, and last activity without forcing the user to open several screens.

Client experience

The client experience is the highest-priority UX surface. It should be guided, branded, mobile-friendly, and forgiving. Clients should not be forced to create an account before participating. Secure link or magic-link access is preferred for the early product because friction at the entry point directly affects completion.

Suggested briefing journey

10. Welcome and purpose
11. Business
12. Brand
13. Audience
14. Goals
15. Project requirements
16. Competitors and references
17. Content and assets
18. Budget and timeline
19. Review and submit

Readiness model

The product should evolve from simple completion percentages to a project-readiness model. A future readiness view should distinguish completed information from missing information, unresolved decisions, scope risks, and required assets.

FUTURE SIGNATURE EXPERIENCE

PROJECT READY should be a meaningful state, not a decorative badge. It should represent that the required information, assets, decisions, and scope assumptions are sufficiently clear for the team to start execution.

10. Front-End Design and Engineering

Direction

Build the product's visual system before the backend

Initial stack

The first implementation can use HTML, CSS, Bootstrap 5.x, and JavaScript. This is sufficient to build a coherent marketing site, dashboard, project screens, brief builder, and client portal while the backend architecture is developed separately.

Design system

Bootstrap should be treated as infrastructure rather than brand identity. The project should define its own design tokens for colors, typography, spacing, borders, radius, shadows, states, and component behavior. This avoids the appearance of an unmodified Bootstrap template and creates a bridge toward later frameworks or component systems.

Core front-end areas

- Marketing website
- Authentication screens
- Dashboard
- Project list
- Project detail
- Template builder
- Client portal
- Files and asset collection
- Settings
- Notifications and feedback states

Responsive behavior

The experience must be designed from the beginning for desktop and mobile. The client portal especially should remain comfortable on smaller screens because client completion is a critical conversion event.

Accessibility and performance

Form labels must remain explicit, color must not be the sole information carrier, interactive elements must have visible focus states, and content hierarchy must remain usable with keyboard navigation. Images and assets should be optimized, page dependencies controlled, and heavy functionality loaded only when needed.

11. Backend and Data Architecture Intent

The system the front end is preparing to become

Backend direction

The working backend direction is Node.js with Express, with PostgreSQL as the relational system of record. File assets should be stored in object storage rather than directly inside the database. The exact implementation may change as validation and scale requirements become clearer.

Conceptual entities

- Users
- Workspaces
- Team members
- Clients
- Projects
- Templates
- Sections
- Questions
- Answers
- Files
- Activity
- Notifications

Security baseline

Because the system may hold business documents, budgets, brand assets, and private client information, security must be designed as a foundational property. The platform should enforce tenant isolation, explicit authorization, secure tokens, signed file access, validation, rate limiting, access logging, and appropriate data-retention controls.

Data philosophy

The system should preserve structured information rather than collapsing every client response into one long text field. Structured data creates opportunities for filtering, analytics, automation, requirements extraction, and future intelligence.

AI architecture principle

AI should sit on top of structured project information rather than becoming a dependency for the core workflow. The system must remain useful without AI. AI can later summarize briefs, identify risks, extract requirements, propose questions, generate planning artifacts, and surface inconsistencies.

12. Business Model and Commercial Path

How the project can become a sustainable company

Revenue model

The primary commercial model is subscription SaaS. Pricing should be tested rather than assumed. The working structure may include a free or low-friction entry tier, a professional tier for individual practitioners, and an agency tier for teams, white-labeling, analytics, and integrations.

Commercial principle

Do not compete primarily on being cheaper. The product should be priced against the value of fewer follow-ups, faster project starts, stronger scope definition, and improved client experience.

Initial customer acquisition

The first acquisition strategy should be founder-led validation. Speak directly with web agencies, demonstrate the workflow using a real client brief, observe completion behavior, and ask for payment. Distribution can later expand through content, agency communities, partnerships, templates, referrals, and integrations.

Revenue milestones

The first commercial objective should not be a large MRR number. The sequence should be: one real user, five active agencies, one paying account, ten paying accounts, meaningful recurring revenue, repeatable acquisition, and only then aggressive growth.

Unit economics to monitor later

- Activation rate
- Brief completion rate
- Time to first project
- Projects per account
- Monthly retention
- Expansion rate
- Customer acquisition cost
- Gross margin
- Support burden

13. Product Evolution and 10-15 Year Direction

Long-term vision without losing the initial wedge

The long-term direction should be understood as a controlled expansion of the same workflow, not a sudden attempt to become a generic enterprise operating system.

Stage 1 - Collect

Collect the information, assets, decisions, goals, requirements, constraints, budget, and timeline needed to understand a project.

Stage 2 - Organize

Turn inputs into a structured, searchable project record that remains accessible to the agency and can evolve as clarification occurs.

Stage 3 - Understand

Analyze the project for missing information, contradictions, risks, scope gaps, and unclear decisions.

Stage 4 - Translate

Turn client language into structured requirements, deliverables, assumptions, dependencies, and a clearer project baseline.

Stage 5 - Activate

Create execution-ready artifacts such as project plans, tasks, milestones, proposals, and integrations into existing project-management platforms.

Stage 6 - Become the handoff layer

The strategic destination is to become the operational layer between the client's request and the service team's execution environment.

LONG-TERM THESIS

Qenrec should own the transition from client conversation to execution, while resisting the temptation to replace every downstream business system.

14. Legal, IP and Ownership Framework

A practical protection plan for the founder

IMPORTANT LEGAL BOUNDARY

A written document can establish authorship, chronology, and the expression of a project concept, but it does not by itself create exclusive ownership of an abstract business idea. The protection strategy must be applied to the specific assets and rights that can be protected.

Copyright and documented expression

WIPO states that copyright protects expression rather than ideas, procedures, methods of operation, or systems as such. Original written specifications, software, databases, graphics, website content, and other qualifying works may be protected according to applicable law.

¶citeÖturn179481search1Öturn179481search5Ö

Nigeria copyright record

The Nigerian Copyright Commission's current Nigerian Copyright e-Registration System (NCeRS) states that copyright exists automatically when an original work is created, and that registration can provide evidence concerning the creation, ownership, and possible date of creation. The Commission states that its registration certificate and related documents can be used in court as evidence of ownership or proof of original content. This makes an NCeRS filing a potentially useful evidentiary step for the written Bible, software, and other qualifying original works.

¶citeÖturn179481search6Ö

Company registration

The Corporate Affairs Commission (CAC) is Nigeria's official corporate registry. Its current guidance states that a company name should undergo a preliminary availability check and then formal name reservation and registration. Company registration provides the legal corporate vehicle through which contracts, bank accounts, ownership structures, and other corporate actions can be managed.

¶citeÖturn179481search0Öturn179481search7Ö

Trademark

Nigeria's official Intellectual Property Office platform states that the Trademark Registry oversees trademark registration and that registered trademarks can provide exclusive rights to a brand name, logo, or slogan within the Nigerian market. This is separate from company incorporation and should be handled through an appropriate clearance and filing strategy.

¶citeÖturn179481search13Ö

Name clearance

The working name Qenrec must not be treated as legally available merely because it is being used in this document. The project should undergo a formal name and trademark clearance exercise before the identity is locked. Existing visible use of similar names is already sufficient reason to treat Qenrec as provisional.

Software and contractor ownership

When third parties create code, brand assets, illustrations, UI work, documentation, or other creative outputs, ownership and permitted use should be addressed in written agreements. WIPO specifically advises businesses to make sure contracts with employees and contractors establish the rights the business needs. [Ncitedturn179481search5](#)

Recommended protection file

Maintain a controlled evidence package containing this Bible, dated specifications, source-code repositories with preserved history, design source files, logo creation records, invoices and contracts with contributors, incorporation records, trademark filings, copyright filings, and dated releases. The purpose is to make the project's chain of title and development history easier to demonstrate.

Legal review items for counsel

- Confirm company structure and founder ownership.
- Clear and reserve the final company name.
- Conduct trademark clearance in intended jurisdictions.
- Determine appropriate trademark classes and filing strategy.
- Review founder IP assignment and any shareholder/founder agreement.
- Review contractor and employee IP assignment terms.
- Review software licensing and third-party dependencies.
- Review privacy, data protection, terms of service, and client-data handling.
- Determine whether any technical invention or design warrants specialist patent/design analysis.

15. Governance, Versioning and Chain of Title

How the project record stays credible over time

Versioning rule

Every material edition of this Bible should carry a version number, date, and change summary. Minor wording changes can increment the minor version; changes to product strategy, legal ownership, or core brand identity should receive a new major or formally approved version.

Change log

Version	Date	Change	Approved by
1.0	12 Aug 2026	Initial master Company, Product & Brand Bible	[Founder]
1.1	[Date]	[Change summary]	[Founder]
2.0	[Date]	[Major strategic / brand change]	[Founder]
2.1	[Date]	[Change summary]	[Founder]

Chain-of-title checklist

- Founder identity and legal entity recorded.
- Final brand name cleared and ownership documentation retained.
- Logo and visual assets created under documented authorship or assignment.
- Source code retained in a controlled repository.
- Contributors sign written agreements covering relevant IP.
- Third-party libraries and licenses documented.
- Product documentation is dated and version-controlled.
- Registrations and filings are stored with receipts and certificates.
- Access to production and source assets is controlled.

Confidentiality principle

Internal business strategy, unreleased product concepts, source code, non-public financial information, customer data, credentials, security details, and trade-secret material should not be treated as public simply because they appear in an internal product Bible. Publication and disclosure decisions should be handled separately.

16. Founder Declaration and Execution Record

A formal sign-off page for the project file

I, the undersigned founder / author, declare that the information contained in this version of the Qenrec Company, Product & Brand Bible represents my documented project concept, product strategy, brand direction, and development intentions as of the date stated below, subject to any third-party material, sources, or contributions expressly identified in the record.

I understand that this document is a record of authorship and project development, and that specific legal rights must be established through the appropriate laws, registrations, contracts, and professional advice. I further acknowledge that the abstract idea of a software product is not, by itself, equivalent to a registered intellectual-property right.

Founder / Author	_____
Legal name	_____
Signature	_____
Date	_____
Witness / Adviser (optional)	_____
Legal review date (optional)	_____

EXECUTION NOTE

For legal use, sign and date the final controlled copy and ask Nigerian counsel which portions should be filed with the relevant authorities. Preserve the signed copy together with the creation files and registration records.

Appendix A. MVP Boundary

What should and should not be built first

The MVP should be intentionally narrow. Its job is to prove that agencies and their clients will use a better project-intake workflow and that agencies will pay for the result.

Build first

20. Landing page
21. Agency signup and login
22. Agency dashboard
23. Create project
24. Website Project Brief template
25. Brief builder with sections and questions
26. Secure client link
27. Client multi-step portal
28. Autosave and resume
29. File upload
30. Review and submit
31. Agency review page

Do not build first

- Full project management
- Billing and invoicing suite
- Large template marketplace
- Dozens of integrations
- Complex enterprise administration
- Proposal automation before core usage is proven
- Advanced AI before structured data quality is proven

MVP success criterion

The MVP succeeds when a real agency can send a real client through the workflow, the client completes it without excessive assistance, the agency receives materially better project information, and the agency is willing to keep using and paying for the product.

Appendix B. Product Risk Register

Risks that must remain visible

Risk	Why it matters	Mitigation	Owner
Commoditization	Existing form and agency platforms already solve parts of the problem.	Own project readiness and structured handoff, not form aesthetics alone.	Founder
Low client completion	If clients abandon the brief, the agency still has the original problem.	Short sections, progress, autosave, reminders, clear language, mobile UX.	Product
Scope creep in product	Too many features can delay launch.	Maintain a strict MVP boundary.	Founder
Security and data exposure	Private client assets create material trust obligations.	Tenant isolation, signed URLs, authorization, auditability, security review.	Engineering
Name collision	Working name may conflict with existing products/marks.	Formal name and trademark clearance before lock-in.	Legal
Weak willingness to pay	Positive feedback does not equal purchase intent.	Pilot with real projects and ask for payment.	Founder

Appendix C. Brand Usage Rules

Protecting consistency as the product expands

32. Use the primary Rufous as a signal, not a full-page wash.
33. Do not introduce a second primary brand color casually.
34. Do not use gradients as the default brand language.
35. Do not allow component libraries to define the brand personality.
36. Use typography to create hierarchy before adding decorative elements.
37. Keep surfaces quiet so important actions and project status remain legible.
38. Keep client-facing language human and task-oriented.
39. Never use AI terminology as decoration when it does not describe real product behavior.
40. Every new feature should reinforce clarity, readiness, or execution.
41. Every major brand change should be reflected in a new approved version of this Bible.

Appendix D. Reference Sources

Source note

External sources are included for legal and strategic context only. They do not replace legal advice. Product, brand, pricing, and technology decisions in this Bible should be revalidated against current market conditions and professional advice before irreversible commitments.

Closing Statement. The standard for the next phase

Qenrec should not be built as a collection of pages. It should be built as a coherent system with a clear point of view: client information should become project clarity, and project clarity should become confident execution.

The project now has a written foundation for brand design, front-end implementation, backend planning, market validation, and legal/IP preparation. The working name remains provisional. The strategic thesis remains focused. The next irreversible steps should be deliberate: validate the product with real agencies, clear the final brand name, establish the founder/entity ownership structure, and then move the approved identity into the software itself.

WORKING NORTH STAR

Collect clearly. Understand deeply. Start confidently.
